

Star signpost RARIM

Star-shaped panels pointing in 8 different directions with many design options.

Star-shaped

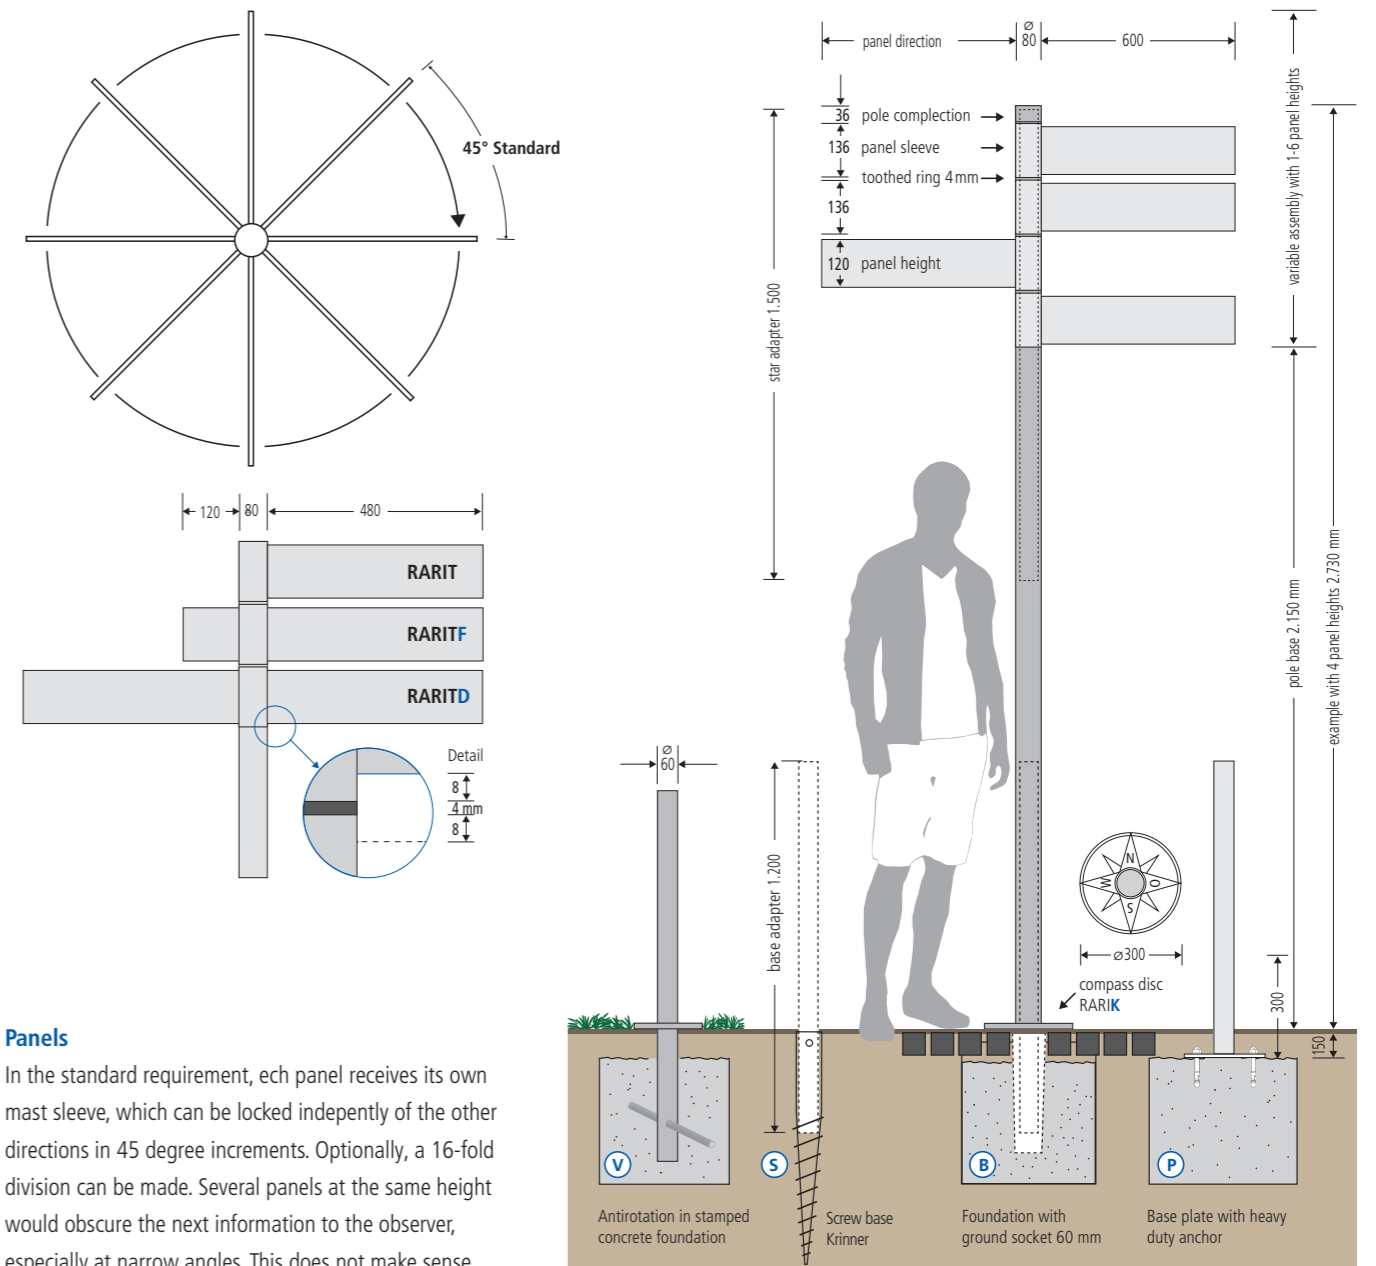

The star-shaped panels pointing in different directions can be individually designed in size, form and color. The thickness of the material is 4mm aluminum. Custom-made with larger surfaces, however, need 6mm thickness, or more. A compass disc shows the heavenly directions while keeping grass away.

Star signpost RARIM

The star signposts of the pipe+surface system offer unsurpassed flexibility.

Panels

In the standard requirement, each panel receives its own mast sleeve, which can be locked independently of the other directions in 45 degree increments. Optionally, a 16-fold division can be made. Several panels at the same height would obscure the next information to the observer, especially at narrow angles. This does not make sense ergonomically. Only with opposite targets are both equally visible. Therefore, the star signpost also allows a 180 degree arrangement at the same height. Interesting is a design variant in which an opposite extension, such as a material fusion appears with coats of arms or logos for example from sponsors can be labeled.
