

Overview freestanding TM

Transparenz offers ease in the communication of information.

Overview freestanding TM

The mobile stand-up signs with transparent value.

transparenz

transparenz

Depending on the graphic design, transparent information carriers show depth, plasticity or lightness in the transmission of information. Double-sided readability is achieved with a light-blocking cover made of foil. In the case of neutral backgrounds, the use of type carriers that remain crystal clear is possible.

Safety glass

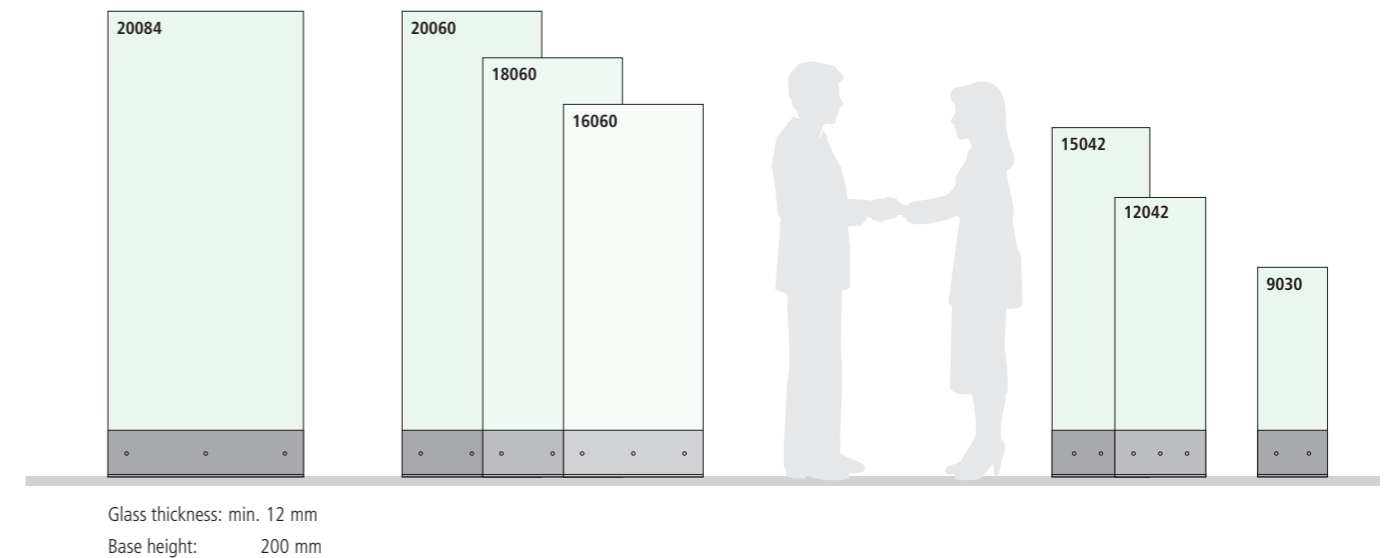

The use of tempered ESG single-pane safety glass or VSG laminated safety glass consisting of 2 panes with an intermediate film is required on site. The glass thickness must correspond to the surface dimension and its clamp fastening.

The ESG version

with clear panes leaves all design options open to the graphic designer. A number of high-quality foils are available with which the back can be individually covered, even semi-transparently. If the green tint typical of glass distorts the colors, we recommend using white glass (optiwhite). It has a reduced green tint.

The VSG variant

is equipped with a matt, semi-transparent intermediate layer, which provides the neutral background for lettering with film text. However, since the glass layers of the commercially available laminated glass are not tempered, the risk of breakage is higher than with the harder single-pane safety glass, toughened safety glass.
